### ABSTRACT:

A user interface for a control structure comprising a controller, and physical devices coupled to the controller is disclosed. The controller is adapted to control and monitor the physical devices. The user interface is coupled to the controller for displaying representations of status conditions of the physical device. The user interface comprises a system database adapted to include the representation of the physical device, means for creating the system database within the user interface, a set of points to be used within the system database, the points being adapted to represent the physical devices and adapted to be accessible from the system database, and a set of pointgroups within the system database, adapted to represent multi-parameter physical devices and adapted for accessibility from the system database, each pointgroup having at least one point linked to the pointgroup, and each point within a pointgroup representing one of the physical parameters of the physical device, the means for creating the system database including means for creating the representations, the creating means using the pointgroups to create the system database and the pointgroups allowing a user to decrease the amount of time spent on creating points for the physical devices.

#### ABSTRACT:

A networked control system includes graphical representations of actual devices coupled to a network. The graphical representations include symbols that provide an actual picture of the devices and means for displaying values and status of the devices. A controller uses a system database to create an application database that is used for controlling and monitoring the devices. The system database and application database combine to form a real-time distributed database for controlling devices on the network. The system database includes templates for the physical devices with a control structure that has prelinked parameters that relate to the representation. A graphic editor allows a user to create the database from templates in the system database. Data and other device parameters are automatically linked to a device symbol when creating the graphical representations. A process controller couples the devices to the network and provides the data and status of the networked device to the system. The system includes a mechanism that automatically organizes communications to the devices into optimized transactions.

#### ABSTRACT:

A system for rapidly and easily searching large collections of documents using standard web browser programs as the user interface. The present invention parses a collection of text documents to identify symbols therein and builds a database file which identifies the file and line locations of each symbol identified. The database file is constructed to permit rapid searching for symbols to permit interactive use of the present invention as a search tool. A database client process interacts with the web browser via standard CGI techniques to convert browser commands and queries into appropriate server process requests. A server process receives such requests and manipulates the database files in response to the requests. Query results returned to the client process are then reformatted by the client process to return a document with hypertext links in place of search keys located in the database (e.g., an HTML page). The system of the present invention thereby provides for rapid searching of large collections of text documents which is not coupled to a specific toolset used to create any one of the documents and which uses a simple and well-known user interface, namely: web browsers.

#### ABSTRACT:

A method using symbols to gather, store, retrieve, manipulate and report information, with attendant improvements in communication, efficiency and efficacy. A customer communication received by an organization is assigned a symbol on the basis of key words within the communication and/or a record of transaction between the customer and the organization. The communication is directed to a communication handler appropriate to the assigned symbol. Using symbols, the customer can provide inputs to the organization regarding satisfaction with the transaction; the organization can then compare these symbols with internally reported symbols to ascertain an accuracy level of the organization's perception of the transaction.
